

### Kinsley North to receive first ever drill test

March 23, 2015

Pilot Gold Inc. (PLG - TSX) ("Pilot Gold" or the "Company") is pleased to report that the 2015 exploration program at Kinsley Mountain has begun.

The program is currently budgeted at US\$2.0 million and will include up to 10,000 metres of RC and 1,000 metres of diamond core drilling. The focus of the 2015 program will be to test a number of high-priority targets, primarily defined by intersections of NW- and NNE-trending structures with favourable stratigraphy that would lead to discovery of additional mineralization similar in nature to the high-grade Western Flank zone. Targets range from early-stage tests in the Kinsley North area to fan drilling of the area between the Western Flank zone and the historic pits. Exploration of this nature is drill-intensive and iterative; the program will be continually evaluated in light of data and interpretations from every drill hole.

"We are excited to get back to work at Kinsley after a rigorous compilation of 2014 results," stated Dr. Moira Smith, Chief Geoscientist, Pilot Gold. "Results continue to refine our geologic model, which will aid in our ability to identify new, high-grade zones of mineralization. I am confident that the high-grade mineralization at the Western Flank is not an isolated occurrence."

2014 was a pivotal year for the project, with results demonstrating that gold is concentrated at the intersections of NW and NNE-trending structures, and that the Secret Canyon Shale horizon, host to the high-grade mineralization in the Western Flank, is a viable stratigraphic target over the entire property. The horizon is largely untested, and it is unlikely that the Western Flank is the only high-grade zone.

Given the high grades and positive metallurgical results from testing of the Secret Canyon Shale-hosted mineralization in the Western Flank zone (see press release of January 19, 2015), the aim of the 2015 program is to identify other zones of mineralization in similar structural settings across the property. Further drilling of the Western Flank target is also planned to fully define its extents, with an emphasis on possible extensions of the mineralization to the east towards the historic Kinsley Mine.

Key targets are the Secret Canyon Shale-hosted targets along the western side of the Kinsley Mountains, (north and south of the Western Flank, and the Racetrack and Secret Spot targets), along the Kinsley trend, the Kinsley North claims, and at the Keneroid target. Further metallurgical testing of sulphide mineralization and a small Induced Polarization (IP) survey are underway.

### **ABOUT KINSLEY MOUNTAIN**

Kinsley Mountain hosts near-surface mineralization similar to other Carlin-style, sediment-hosted gold systems. The property consists of 475 claims on U.S. Bureau of Land Management land plus 5 leased patents totalling 9,575 acres (3,875 hectares) and hosts a past-producing mine with an extensive exploration database and numerous, untested gold targets.

The Company holds approximately 79.1% of Kinsley. Intor Resources Corporation ("Intor"), a subsidiary of Nevada Sunrise Gold Corp., is the Company's joint venture partner at Kinsley.

Kinsley Mountain is an early-stage exploration project and does not contain any mineral resource estimate or estimate of mineral resources. Theopateial quateitiate anrogdatediscloeasal
